Water Chlorination System is effective against many pathogenic and non-pathogenic bacteria, but it does not kill all viruses, cysts, or worms at normal dosage rates. Water used for drinking and cooking should be free of odor, slime-producing bacteria, and pathogenic (disease-causing) microorganisms that cause such illnesses as typhoid fever, dysentery, cholera, and gastroenteritis. Often combined with a water filtration system, Chlorination Systems are an excellent and cost-effective way to disinfect drinking water supplies, eliminate odors, and oxidize iron and other metals.
