The majority of the energy used by an air compressor is converted to heat, and as air temperature increases, the capacity for the air to store water vapor also increases. Manufacturers commonly use aftercoolers to combat both issues. Aftercoolers are heat exchanger units that remove heat and water vapor from compressed air so pneumatic equipment can use it safely. The water cooled aftercooler is a product that cools the hot and humid air discharged from the compressor with cooling water, and condenses and separates the contained water.

The global Water-Cooled Aftercooler market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
