Water-cooled reactors are suitable for occasions where the heat dissipation environment is very poor. There are two types of water-cooled reactors. One is a product with integrated water and electricity, that is, using a hollow core wire as a water pipe cooling device for cooling, and the other is a water and electricity separation cooling method. , The water circuit does not pass through the winding, and the separation of water and electricity does not affect each other, and the heat of the winding and the iron core is indirectly absorbed through the cooling plate.

United States market for Water Cooling Reactor is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
