A water demineralizer is a device that removes impurities from tap water or well water. Natural water and tap water contain metallic components such as calcium and chlorine ions, which are removed by a water demineralizer. The amount of impurities reduced varies depending on the application. An ultra-pure water demineralizer is a device that produces water with very few impurities.

Water demineralizers range from devices that produce small amounts of pure water in laboratories to large-scale devices that produce large amounts of pure water in factories.

The global Water Demineralizer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
