The global Water Disinfection Systems market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

In general, disinfection systems work by dosing the water with a controlled amount of a chlorine or chlorine dioxide compound, which quickly inactivates or oxidises bacteria and virus which could otherwise cause infection or allow the proliferation of harmful pathogens, such as Legionella. Unlike chemical approaches to water disinfection, UV light provides rapid, effective inactivation of microorganisms through a physical process. When bacteria, viruses and protozoa are exposed to the germicidal wavelengths of UV light, they are rendered incapable of reproducing and infecting.
