Abstracts

The water flow regulating valve is an intuitive and simple flow regulating control device. The flow regulating valve used in the pipeline network can directly set the flow according to the design. The valve can automatically eliminate the remaining pressure head of the pipeline and the pressure fluctuation caused by the action of water. No matter how the system pressure changes, the set flow rate remains unchanged. These functions of the valve make the flow adjustment of the pipe network complete at one time, turning the network adjustment work into a simple flow distribution, and effectively solve the hydraulic imbalance of the pipe network.
