## Abstracts

The global Water Pollution Source Online Monitoring System market size is predicted to grow from US\$ 1277 million in 2025 to US\$ 1781 million in 2031; it is expected to grow at a CAGR of 5.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The online monitoring system for water pollution sources is an automated equipment system used to monitor the concentration of pollutants in industrial wastewater, urban sewage and other discharged water bodies in real time. It usually includes water quality analysis instruments, data acquisition and transmission terminals, software platforms and remote monitoring centers. The system can monitor key indicators such as COD, ammonia nitrogen, total phosphorus, total nitrogen, pH, turbidity, etc., to help environmental protection departments and enterprises achieve compliant emissions and pollution prevention and control. The price of a complete system generally ranges from RMB 100,000 to RMB 1 million, depending on the number of monitoring projects, accuracy, brand and whether installation and commissioning services are included. Some high-end customized systems are even more expensive. Its main consumer groups are government environmental protection regulatory departments, industrial enterprises (such as chemicals, pharmaceuticals, papermaking, electroplating, etc.), sewage treatment plants and industrial parks. Consumption areas are mainly concentrated in economically developed, industrially intensive or strict environmental protection policies. In recent years, with the tightening of environmental protection supervision and the promotion of the 'dual carbon' policy, the demand for this system has continued to grow.
