Cables designed to be submerged in water or in constant contact with water are usually designed to be both laterally and longitudinally watertight. Laterally watertight ensures that water can't penetrate into the cores of the cable. Longitudinally water tight cable is designed with a barrier to the spread of moisture along the cable length.

Longitudinal and lateral water-tightness can be achieved in a number of ways including the use of water-blocking or water swellable tapes and water swellable powders. Lateral water tightness can also be achieved with certain water resistant rubber sheathing

materials.
