The water washing method separates CO2 and CH4 based on the different solubilities of different gases in water under a certain pressure. In actual projects, the methane recovery rate of the water washing process is generally high, which can reach more than 98%. The energy consumption is relatively low, and some H2S can also be absorbed. However, the foam in the water solvent must be scraped out in time, and water must be replenished regularly. At the same time, attention must be paid to Discharge the leaked water solvent after treatment. In addition, during the water solvent regeneration process, H2S will be discharged as waste gas, which needs to be treated before being discharged.

Water scrubbing biogas purification equipment is a device used to improve the quality of biogas, making it suitable for a wider range of uses, such as injection into natural gas pipeline networks or use for power generation. Market drivers influence the demand and development of this type of equipment. Here are some possible factors:

Environmental regulations: Government regulations on waste disposal and greenhouse gas emissions have a significant impact on the water scrubbing biogas purification equipment market. This type of equipment helps reduce greenhouse gas emissions and
