Water source heat pump heat exchangers achieve heating and cooling of buildings by exchanging heat with natural water sources such as groundwater, lake water or seawater. This type of heat exchanger usually adopts plate or shell and tube structure, where the plate heat exchanger consists of a series of thin metal plates, and the refrigerant flows between the plates and indirectly contacts the external water source, thereby efficiently transferring heat; while the shell and tube type contains one or more pipes, with the refrigerant flowing inside and surrounded by the water source outside, and the two exchange heat through the pipe wall.
