The global Water & Wastewater Treatment Membranes market size is predicted to grow from US\$ 8614 million in 2025 to US\$ 12740 million in 2031; it is expected to grow at a CAGR of 6.7% from 2025 to 2031.

Membranes are used in water treatment to separate pollutants from water based on properties such as size or charge. Common membrane processes include microfiltration, ultrafiltration, nanofiltration, reverse osmosis, and electro dialysis.

Drinking fresh water is a fundamental aspect of human existence. With the rapid increase of population, the problem of water resources is getting worse day by day, and the effective use of existing resources has become the requirement of the times. Technological advances have reduced pressure on existing freshwater resources. Seawater can be converted into drinking water using this technology. Also, desalination plants using this technology have been a boon for people and countries with limited water resources. However, dirt is a major problem and it adversely affects its functionality. It reduces its proficiency and mobility, leads to increased energy utilization and damages the quality of water or streams.
