The global Waterborne Ceramic Coatings market size is predicted to grow from US\$ 740 million in 2025 to US\$ 1040 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

The waterborne ceramic coating is made of pure inorganic compound and water-soluble carrier, nano inorganic resin as the main base material, nano metal oxide, silicon dioxide and high weather resistant inorganic pigment with high hardness and wear resistance. An inorganic ceramic coating is formed on the surface of aluminum substrate after ceramic coating. Inorganic ceramic coating is a kind of high-performance coating, with high hardness, high wear-resistant physical and chemical properties, high strength of acid, alkali, salt, solvent, anti-corrosion chemical properties, at the same time, it has super long color retention, anti pulverization, aging resistance, super long weather resistance, air pollution resistance, high degree of self-cleaning performance and high temperature resistance, non flammability, class A1 fire resistance. It is the latest green environmental protection coating, which conforms to the SGS environmental protection standard of European Union, and has passed the FDA certification test of food contact test standard of us food and drug administration. It is harmless to the environment and human body, non-toxic, pollution-free, and has high safety performance. The water-based ceramic coatings are rich in colors, including white, plain, bright, light, light silver and so on, a wide range of color options. It is widely used in aerospace industry, Metro high-speed rail and other rail transit fields, such as office buildings, shopping malls, hotels, hospital stations, stadiums, exhibition halls, airports and other buildings indoor and outdoor decoration, building curtain walls.

Nano inorganic resin is used as the main base material for waterborne ceramic coatings. There are repeated Si-O bonds with high bond energy and strength on the

main chain. Its stable chemical structure determines the advantages of the physical and chemical properties of the coatings. Compared with the typical organic C-C and C-F bonds, the inorganic structure is undoubtedly more durable, has inherent thermal stability, and is not affected by sunlight and ultraviolet rays, Inorganic structure has its special nonflammability, while organic polymer can burn and smoke and produce toxic smoke. After coating on the surface of the substrate, the coating is cured by heating to form a coating with properties similar to those of ceramics and glass, so it is called inorganic ceramic coating. Ceramic coating is a new type of inorganic nano material developed from the technical requirements of aerospace industry, which is currently in the most cutting-edge field of coating industry. As an inorganic coating, ceramic coating has more powerful performance advantages than traditional organic coating, so it is also called 'the third generation curtain wall coating'.
