Manual steering of power boats becomes difficult the larger and more powerful the boat, especially those outfitted with multiple engines. That's when helm hydraulic assist systems become a necessity for good control and safe, pleasurable boating.

Hydraulic steering is made up of three components: a pump with an integral reservoir for hydraulic oil, a ram that connects to a rudder or outboard engine, and connecting lines that transmit inputs from the steering pump to the steering ram. It's very simple and, when sized and installed correctly, makes for a mostly carefree system. Turning the steering wheel in either direction pumps oil through the lines to the ram, which in turn pulls or pushes the rudder, outboard, or sterndrive in the desired direction.
