Waterproof drysuits and wetsuits are specialized garments designed to provide protection and insulation in water-based activities. Both types of suits serve the purpose of keeping the wearer dry and maintaining body temperature in wet conditions, but they differ in construction and usage.

Drysuits: A drysuit is a full-body suit that provides complete protection from water by creating a sealed barrier between the wearer and the environment. It is typically made from waterproof and breathable materials such as neoprene or Gore-Tex. Drysuits feature watertight seals at the wrists, neck, and ankles, along with a waterproof zipper or entry system. They are worn with insulating layers underneath to maintain warmth in

cold water or environments. Drysuits are commonly used in activities that involve prolonged submersion or exposure to harsh conditions, such as diving and water rescue operations.

Wetsuits: A wetsuit, on the other hand, is made from a flexible and insulating material, usually neoprene. Unlike drysuits, wetsuits are not fully waterproof but are designed to trap a thin layer of water between the suit and the wearer's skin. This water layer is heated by the body and acts as insulation, keeping the wearer warm. Wetsuits fit tightly to minimize water flushing in and out of the suit. They are commonly used in water sports like surfing, diving, and paddleboarding, where the wearer is in and out of the water frequently.
