## Abstracts

The global Wearable Electronic Devices market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Wearable electronics are smart electronic devices that can be connected to the internet and be worn on the body as accessories. These devices are a key segment of IoT devices, and they can exchange data through internet with the user and other connected devices. IoT overall is a network of physical objects interconnected through various network technologies.

Despite attaining unit sales of 42 million and posting volume sales growth of 15%, wearable electronics did not live up to expectations in 2017, as consumers failed to flock to these devices in the droves that many in the industry had anticipated only a couple of years before. Although wearable electronic devices have certainly carved out a solid niche for themselves as useful products for health and fitness enthusiasts, they have so far failed to make much of an impression on the wider consumer base. Beyond the sizeable number of individuals who are looking for a greater amount of feedback regarding their exercise regimes – a function that wearable electronics are singularly well-equipped to perform – most consumers in the US continue to see these devices as superfluous; beyond health and fitness tracking, most wearable electronic devices do not provide any functionality that the average consumer cannot already easily access through their smartphone. It does appear, however, that consumers are increasingly

turning to wearable electronics when they wish to replace their traditional watches.
