A weather station gateway is an intelligent data collection and communication device used to connect and manage multiple meteorological sensors. It aggregates, processes, converts protocols, and regularly uploads raw data collected by sensors at various locations, including temperature and humidity, wind speed and direction, rainfall, and air pressure. It typically features local storage, data verification, resumable transmission, and multiple communication interfaces (such as RS-485, LoRa, 4G, Ethernet, and NB-IoT). It transmits on-site meteorological data in real time to a cloud platform or monitoring center. It serves as the core hub for building meteorological monitoring networks and is widely used in agriculture, water conservancy, transportation, urban environment, and scientific research.In 2024, the global production of weather station gateways will reach 293,870 units, with an average selling price of US$470 per unit.
