Web Guiding Actuators are Kits of web-guiding systems. Web-guiding systems are used in the converting industry to position flat materials, known as webs, before processing. They are typically positioned just before a critical stage on a converting machine. Each type of web guiding system uses a sensor to monitor the web position for lateral tracking, and each has an web guiding actuator to shift the running web mechanically back on course whenever the sensor detects movement away from the set path.

To ensure that the material is wound round the reel in a straight line, the web guiding actuator has unwind or rewind stations to guide the material into its correct position.
