Web Guiding Controllers are necessary to properly align web material being transported through roll-to-roll converting machines. Without web guiding systems and principles a number of factors such as process variations in tension and speed, material property variations in regard to quality, improperly maintained machines, changes in traction and so on, can affect the proper alignment of material.

Web guides work to keep material aligned while being transported through a web. When moving through rollers, web materials tend to align themselves perpendicular to the axis of the rollers. Without a guiding system in place the material would misalign (think of how easily a garden hose telescopes when rolling it up on a retractable reel).

As any flexible material is transported through a web it is subjected to the “normal entry rule” – which basically means that the rollers in the converting machine must be aligned properly. Normal entry must be applied when transporting webs or the results will be much like the garden hose – misaligned. Normal entry is accomplished by deliberately setting or programming the axis of rotation of the guide roller in order for the material to be steered or guided into a different position.
