Web tension sensors use a voltage or current source to measure web tension parameters. They are used on continuous processing machinery for applications such as printing, slitting, cutting, embossing, punching and forming. Web tension sensors consist of transducers and are used with strain gages, devices that measure changes in electrical resistance. As weight is applied, the transducer beam stretches or compresses and the strain gage measures the corresponding change in electrical resistance. Typically, transducers are placed at each end of an idler roll that is suspended in a machine frame. The initial weight is subtracted from the roller, and the transducers measure the added force placed upon the roller from the web. The output signal that corresponds to the actual tension is then amplified to coincide with the magnitude of the desired tension setpoint.
