A Website Vulnerability Scanner is a tool used to detect and identify security vulnerabilities present in web applications or websites, normally from the outside, to look for security vulnerabilities such as Cross-site scripting, SQL Injection, Command Injection, Path Traversal and insecure server configuration. This category of tools is frequently referred to as Dynamic Application Security Testing (DAST) Tools. The scanner typically works by simulating various attack scenarios against the target website or web application. It automatically crawls through the site, analyzing the code, forms, inputs, and other elements to identify potential weaknesses. Once vulnerabilities are identified, the scanner generates reports detailing the issues found, along with recommendations for mitigation or remediation. This information helps website owners and administrators to prioritize and address security issues before they are exploited by malicious actors. Some website vulnerability scanners offer additional features such as ongoing monitoring, automatic patching, and integration with other security tools to provide a comprehensive security posture for web applications and websites.

The global Website Vulnerability Scanner market size is projected to grow from US\$ 2219 million in 2024 to US\$ 4518 million in 2030; it is expected to grow at a CAGR of 12.6% from 2024 to 2030.
