The Weighing Liquid Filling Machine is an automated device that achieves quantitative liquid filling based on high-precision weighing technology. Its core operating principle involves real-time monitoring of mass changes in the liquid within the filling container through an integrated high-sensitivity weighing sensor, which converts the weight signal into an electrical signal transmitted to the control system. The control system precisely regulates the opening/closing time of the filling valve or the pumping speed based on a preset target weight, incorporating dynamic compensation algorithms and flow regulation mechanisms to achieve closed-loop control of the liquid filling volume. Equipped with a high-resolution weighing module, rapid response characteristics, and anti-interference capabilities, this machine effectively mitigates the impact of liquid viscosity, flow rate fluctuations, and environmental vibrations on filling accuracy, ensuring compliance with stringent quality standards.
