The global Welding Forming Machine market size is predicted to grow from US\$ 222 million in 2025 to US\$ 311 million in 2032; it is expected to grow at a CAGR of 3.5% from 2026 to 2032.

In 2025, the global production of warm upsetting machines reached 1,136 units, with an average price of approximately US\$200,000 per unit. The global annual production capacity of warm upsetting machines was approximately 1,550 units, with a gross profit margin of approximately 28.2%. A warm upsetting machine is a specialized piece of equipment used in metal processing. Its core function is to perform upsetting forging of metal bars or wires within a range above room temperature but below the recrystallization temperature of the metal. This equipment uses a heating system to locally or entirely heat the metal billet to a suitable temperature, and then uses dies and pressure mechanisms to apply pressure to the metal, causing it to undergo plastic deformation in a hot state, thereby obtaining parts with the desired shape, size, and properties. Warm upsetting machines combine some of the advantages of hot forging and cold forging, reducing the metal's deformation resistance, improving forming accuracy and surface quality, and reducing die wear. They are suitable for producing complex-shaped metal parts made of medium carbon steel and alloy steel, and are widely used in the automotive, machinery, and aerospace industries. The upstream of warm upsetting machines includes high-metal rods, high-precision machine tool spindles, servo/hydraulic units, etc., the midstream consists of warm upsetting machine manufacturers, and the downstream is mainly used in industries such as automobiles, aerospace and machinery manufacturing.
