A well intervention or well work is any operation carried out on an oil or gas well during or at the end of its productive life. The intervention alters the state of the well or well geometry, provides well diagnostics, and manages the production of the well. It enables safe entry into a well with well control in order to carry out numerous tasks other than drilling. The history of well intervention dates back to the 1800s, when the technology was first developed to afford re-entry into wells as an alternative to drilling well control systems and rigs for delivery of non-drilling services.

Demand for well intervention services in offshore areas has been increasing due to rise in demand for crude oil and fuel, increase in preventive steps taken for aging wells, rise in the number of drill rigs, and decrease in productivity of various gas and oil wells.
