A wellhead compressor is a mechanical device installed at or near the wellhead of an oil or gas well. Its primary function is to boost the pressure of the gas coming from the well, ensuring that it can be transported efficiently through pipelines to processing facilities or storage units. This is particularly important when the natural reservoir pressure declines, making it difficult for the gas to flow unaided. Wellhead compressors help maintain production levels, enhance the recovery of hydrocarbons, and improve the overall efficiency of the extraction process. They are crucial in extending the productive life of a well and maximizing the output of gas reserves.

The global Wellhead Compressor market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
