The global Wet Biaxially Stretched Separator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Wet biaxially stretched separator is a kind of lithium battery separator. It is made by mixing polyethylene (PE) and paraffin oil, heating and melting it to form a uniform mixture, then cooling it to phase separate, pressing it to obtain a diaphragm, and then the film is stretched both vertically and horizontally to make the micropores on the separator nearly circular. Finally, solvent extraction is used to remove the residual paraffin oil, and a separator with an interconnected microporous structure is prepared. The advantages of the wet biaxially stretched separator are that it has small pore size, uniform distribution, good air permeability, and high mechanical strength, making it suitable for producing thinner separators. The disadvantage of wet biaxially stretched separators is that it has a high thermal shrinkage rate and requires heat treatment to reduce its dimensional stability. Wet biaxially stretched separators are mainly used in high-end power batteries and energy storage batteries.

United States market for Wet Biaxially Stretched Separator is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Wet Biaxially Stretched Separator is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
