The report requires updating with new data and is sent in 48 hours after order is placed.

The wet film thickness gauge is a tool designed to measure the thickness of liquid coatings in the simplest and fastest way. The wet film thickness gauge has notches or teeth machined to the side of the gauge. The endpoints of the meters are used as references to each other. For a particular side, the two notches have the same size and act as a zero reference, which represents the substrate. The notch on the same side is shorter than the outer notch. Each of these represents a different distance from the outer edge tooth corresponding to zero. The distance represents the surface thickness of the wet coating to be measured. The groove is marked with mils 0.001 inch, which is equivalent to the groove. The wet film thickness gauge must be placed at an angle of 90 degrees with the coating material and must be in full contact with the coating material. After the gauge is removed from the material, the depth is determined by the mil of the largest notch wetted by the paint and the smallest notch not wetted. For example, if the maximum wet notch is 8 mils and the minimum non wet notch is 10 mils, it can be said that the wet film thickness is 8 to 10 mils. It measures the thickness immediately after coating the material. Wet film thickness gauge can measure the thickness of almost all types of organic coatings, such as varnishes, lacquers, paints, resins and gel coats.
