The global Wet Laid Nonwoven Fabric market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The wet laid nonwoven fabric is the fabric made by the wet laid, in which the fibers are stirred, mixed and oriented by the action of water or other solvents, and then heated or chemically treated to finally form a cloth. Currently, in the production of Freudenberg Performance Materials' wet-laid nonwovens, short fibers with fiber lengths up to 12 mm are usually mixed with viscose or wood pulp and suspended in water using large tanks. The water fiber or water slurry dispersion is then pumped and continuously deposited on the forming wire. The water is sucked out, filtered and recycled. More than 30% of the fiber content of the wet-laid nonwoven fabric is composed of fibers with an aspect ratio greater than 300, and its density is less than 0.40g/cm³.

The wet laid manufacturing process can achieve better bonding between fibers, thereby obtaining nonwovens with good strength and feel. Wet-laid nonwovens have the characteristics of good water absorption, softness and comfort, and have been widely used.
