A white box server refers to customized servers that are either home built, or built by white box suppliers called ODMs (Original Design Manufacturers) such as Supermicro. The term white box simply means that the equipment is unbranded or generic. All parts are purchased separately which helps cut costs as well as provides hobbyists and data center professionals alike more customization to better fit their needs. The ease of customization allows for individual parts to be replaced, rather than replacing the entire server when equipment fails. White box servers are increasingly being used by the Open Computer Project (OCP) which was developed by Facebook.

White box servers are usually purchased in bulk quantities from suppliers called original design manufacturers (ODMs). An ODM typically builds their servers with commercial off-the-shelf (COTS) components that can be assembled in slightly different ways or upgraded to provide the customer with a degree of system customization. Although it is feasible for an organization to construct and customize a white box server in-house from commercially available retail computer parts, an ODM can manufacture and deliver customized servers faster and perhaps offer warranty protection for parts.

The drawback of choosing a white box server over a standard OEM server, is that they are less reliable and the components often lack redundancy. White box servers lower their risks of downtime by using clustering techniques for deployment. A cluster enables high availability in a computer system by grouping servers together to act like as a single system. With this in mind, a company should do a strong evaluation on the pros in cons of deploying white box servers to ensure that it is actually cost-effective.

The global White Box Servers for Cloud Computing market size is projected to grow from US\$ 3565 million in 2024 to US\$ 7637 million in 2030; it is expected to grow at a CAGR of 13.5% from 2024 to 2030.
