## Abstracts

The global White Carbon Black from Rice Husk Ash market size is predicted to grow from US\$ 631 million in 2025 to US\$ 1326 million in 2032; it is expected to grow at a CAGR of 11.4% from 2026 to 2032.

In 2024, global White Carbon Black from Rice Husk Ash production reached approximately 68,000 tons, with an average global market price of around US\$8,000 per ton. In 2024, the global 's total production capacity of White Carbon Black from Rice Husk Ash reached 85,000 tons. The industry average gross profit margin of this product reached 32%. White Carbon Black from Rice Husk Ash is a functional amorphous silica powder primarily produced from rice husk ash. It is named 'white carbon black' because of its reinforcing properties in rubber comparable to traditional carbon black and its white appearance. Its main chemical component is silicon dioxide (SiO<sub>2</sub>), with a porous microstructure characterized by high specific surface area and high reactivity. As an important green chemical raw material, it is widely used in the rubber industry as a reinforcing agent to improve the mechanical properties and wear resistance of products; it is also used as a thickener, matting agent, or adsorbent in plastics, coatings, paints, pharmaceuticals, and personal care products. Unlike the traditional 'wet process' production using quartz sand and soda ash as raw materials, rice husk ash silica utilizes rice husks, an abundant agricultural waste, achieving waste-to-resource transformation and sustainable resource utilization.

The White Carbon Black from Rice Husk Ash industrial chain is a complete system spanning upstream agriculture, midstream processing and manufacturing, and downstream diversified industrial applications. The upstream of the industry chain is rice cultivation, which mainly provides rice husks as the core raw material. Rice husks are a major byproduct of rice processing. The midstream of the industry chain involves the

preparation of rice husk ash and silica. First, rice husks are converted into rice husk ash through combustion or gasification. Rice husk ash is rich in amorphous silica. Then, through different processes such as extraction, roasting, acidification, or alkali fusion, silica products that meet different application requirements are extracted and prepared from the rice husk ash. This part is completed by specialized processing companies. The downstream of the industry chain extends to the rubber and tire industry, the plastics industry, the coatings and paint industry, the personal care industry, and other industrial sectors that require functional silica fillers. In addition, relevant standards-setting bodies regulate product quality throughout the industry chain.

The White Carbon Black from Rice Husk Ash industry has a promising future, driven by both the demand for green materials and the trend of resource utilization of agricultural waste. Market research indicates that this market is expected to maintain stable growth in the coming years. On the one hand, the global pursuit of sustainable and environmentally friendly materials is driving industries such as tires, rubber, coatings, and personal care to adopt more silica derived from renewable resources. On the other hand, the market size in major production regions is expected to continue to expand, with highly dispersed silica expected to further increase its market share due to its superior performance. Furthermore, utilizing rice husks to produce silica not only provides a high-value-added outlet for large amounts of agricultural waste and reduces the environmental pressure from incineration, but also aligns with the development concept of a circular economy. In the future, with continuous advancements and optimization of extraction technologies, the performance and application areas of rice husk ash silica are expected to expand further; however, the industry also needs to address challenges such as technology cost control and market competition.
