The global White Light Interference Microscopy market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

White Light Interference Microscopy (WLIM) is an optical microscopy technique that utilizes the interference of white light to produce high-resolution three-dimensional images of transparent and semi-transparent samples. It is particularly useful for studying surface topography and measuring thickness variations at the nanoscale.

Advancements in camera technologies and data processing may contribute to the development of high-speed WLIM systems. This can enable faster acquisition of three-dimensional images, making the technique more suitable for dynamic processes and real-time imaging.
