A whole house central water filtration system is a comprehensive water treatment system that is installed at the main water supply line to filter and purify the water for the entire house. Unlike point-of-use filters that are installed at specific faucets, a whole house central filtration system treats all the water that enters the house, providing clean and safe water from every tap. The primary purpose of a whole house central water filtration system is to remove impurities and contaminants from the water supply. These impurities can include sediment, chlorine, heavy metals, pesticides, bacteria, viruses, and other harmful substances. By filtering out these contaminants, the system improves the overall quality and taste of the water, making it safe for drinking, cooking, bathing, and other household uses.

The global Whole House Central Water Filtration System market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
