Wind pressure transmitter refers to a transmitter used to measure wind pressure. It is widely used in various industrial automatic control situations, involving fire protection, environmental protection, medical, aviation, industrial control and many other industries. The working principle of the wind pressure transmitter is to use the pressure of the wind to directly act on the strain diaphragm of the sensor, causing the strain diaphragm to produce tiny deformations proportional to the medium pressure. The resistance of the sensor changes, and the resistance of the sensor is amplified through the amplification circuit. Weak changes are amplified and the wind pressure value is converted into a standard 4-20Ma current output or 0-5V or 0-10V output.

United States market for Wind Difference Transmitter is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
