Wind energy conversion system is a system that converts wind energy into another form of energy, such as electricity, that can be used to power homes and businesses. The principle of the wind energy conversion system is to use wind power to drive the rotation of windmill blades, and then increase the speed of rotation through the speed booster to promote generator power generation. Simply put, the wind energy conversion system is the process of converting wind energy into mechanical energy, and then converting mechanical energy into electrical energy. That is, wind power. This process does not require fuel or radiation, and does not produce air pollution, which is a clean energy source. One of the core components of the wind energy conversion system's power generation system is the generator. Wind power converts mechanical energy into alternating current through generators. Different generator types are suitable for different drive chain structure types.
