The global Wind Power Epoxy Resin Curing Agent market size is predicted to grow from US\$ 1298 million in 2025 to US\$ 1992 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Epoxy resin curing agent for wind turbine blades is a key chemical material used to cure epoxy resin. It forms a three-dimensional network structure by cross-linking reaction with epoxy groups, transforming the resin from liquid to solid, thus giving wind turbine blades the required mechanical strength, fatigue resistance, weather resistance and impact resistance.

Market drivers for epoxy resin curing agents for wind turbine blades: As the wind power industry develops towards large-megawatt models, the increase in blade length requires curing agents to have higher toughness and fatigue resistance. Global carbon emission reduction policies (such as EU carbon tariffs) promote the application of green materials. Developers pursue low LCOE (levelized cost of electricity) and promote low-cost curing agents (such as domestic substitution).

Market challenges: Raw material fluctuations affect curing agent costs. Raw materials such as epichlorohydrin (ECH), amine compounds (such as polyetheramines), and anhydrides are greatly affected by oil prices and supply and demand. The offshore wind power environment is harsh (high salt spray, high humidity, ultraviolet radiation), and the blades need to be corrosion-resistant for a long time. Offshore wind power has strict requirements on corrosion resistance and high technical barriers.
