The global Wind Power market size is predicted to grow from US\$ 79796 million in 2025 to US\$ 118167 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Wind power generation means getting the electrical energy by converting wind energy into rotating energy of the blades and converting that rotating energy into electrical energy by the generator. Wind power or wind energy is the use of wind turbines to generate electricity. Wind power is a popular, sustainable, renewable energy source that has a much smaller impact on the environment than burning fossil fuels. Wind farms consist of many individual wind turbines, which are connected to the electric power transmission network.

Key upstream inputs include steel and large cast/forged parts, composite materials (glass/carbon fiber + resin for blades), bearings and gearboxes, power electronics and controls, transformers/cables, and (for selected designs) rare-earth permanent magnets; the midstream comprises turbine design and final assembly, type certification and grid compliance (engineering and validation commonly align with the IEC 61400 standards family), and projectized delivery integrated with tower supply, heavy logistics/erection, foundations and electrical balance-of-plant. Downstream buyers are primarily wind-farm owners/developers (utilities, IPPs, state-owned or regional energy platforms, infrastructure funds), typically procuring via tenders or framework agreements that lock platform selection, delivery schedule, and availability/warranty terms.

United States market for Wind Power is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Wind Power is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
