The wind-suction insecticidal lamp is a physical control device that combines the principles of light attraction and airflow attraction. It uses light of a specific wavelength to attract phototactic pests. When the pests approach the light source, the strong airflow generated by the built-in fan sucks them in and collects them in the insecticide bin or net bag, causing them to dehydrate and die. The device is chemical-free and environmentally friendly. It is widely used in agricultural planting areas, orchards, forest areas, and urban and rural green belts to effectively control the number of pests and ensure crop and ecological safety.
