Wind turbine blade ceramic coating is a high-performance protective coating used on the surface of wind turbine blades. It is mainly composed of ceramic materials and is designed to improve the durability and corrosion resistance of the blades. The coating can effectively resist wind, sand, ice, snow and chemical corrosion, reduce wear on the blade surface, and reduce air resistance to improve wind energy utilization efficiency. In addition, some ceramic coatings have anti-icing properties, which can reduce the accumulation of ice and snow in cold environments and ensure the normal operation of blades. With the rapid development of the wind energy industry, ceramic coating technology continues to advance and is applied to onshore and offshore wind turbines to help effectively utilize renewable energy.
