The global Wind Turbine Pitch and Yaw Control System market size is predicted to grow from US\$ 1036 million in 2025 to US\$ 1438 million in 2031; it is expected to grow at a CAGR of 5.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Wind turbines are designed to generate electricity as cheaply as possible by utilizing wind energy. Therefore, wind turbines are generally designed so that they yield maximum output at wind speed of around 33 mph. They are designed specifically for certain wind speed. In case of stronger winds, it is necessary to waste the part of wind energy attacking on to the rotor blades, in order to prevent any significant damage to the turbine. Pitch and yaw control systems are used to prevent such damage. At high wind speed, pitch angle control or adjustments is the most effective way to control the power output. This is achieved simply by changing the aerodynamic force on the blade. When the power output becomes too high, the electronic controller immediately sends a signal to pitch control mechanism. The pitch control mechanism then pitches or turns the rotor blade slightly away from approaching direction of the wind. The pitch system also brings back the rotor to original position when the desired wind speeds are achieved.

According to the Global Wind Report 2023 released by the Global Wind Energy Council, by 2024, the newly installed capacity of global onshore wind power will exceed 100GW for the first time; by 2025, the newly installed capacity of global offshore wind power will also reach 25GW. In the next five years, the newly added grid-connected capacity of

wind power will reach 680GW. The report also shows that the United States and Europe may experience a supply bottleneck of wind turbines and components in 2025. It recommends that national policymakers take immediate action to increase investment in supply chains to meet their rapid growth in demand and avoid supply chain bottlenecks hindering the development of wind power. In addition, according to Wood Mackenzie statistics, China is the largest and fastest-growing market for wind power generation in the world, accounting for more than half of the market share. Data from the National Energy Administration of China also shows that China's installed wind power capacity ranks first in the world, with a capacity of nearly 400 million kilowatts.
