The global Wind Turbines Plain Bearings market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Wind turbine plain bearings are crucial components in the operation of wind turbines, serving as the mechanical elements that enable the controlled movement and rotation of various parts within the turbine structure. These bearings provide low-friction support to shafts and other rotating components, allowing for smooth and efficient operation of the turbine. They play a vital role in facilitating the conversion of wind energy into electrical power by allowing the rotor and other moving parts to function with minimal resistance.

Plain bearings have cost-effective advantages over rotor bearings. In line with the trend of larger wind turbines, plain bearings have no rolling elements and change point contact to surface contact. The structure is simpler and the bearing capacity is more stable. This structure is more adaptable to the complex and harsh conditions of offshore operations. In addition, plain bearings cost only 70% of rotor bearings and are easy to maintain, which can effectively reduce the procurement and operation and maintenance cost pressures of downstream customers.

At present, the wind power bearing industry is mainly dominated by rolling bearings, and the market penetration rate of sliding bearings is low. With the continuous advancement of the trend of large-scale wind power and cost reduction, sliding bearings are gradually showing their advantages due to their strong load-bearing capacity and low cost. We believe that sliding bearings will gradually replace rolling bearings in the future, and the wind power sliding bearing market has broad room for growth.
