Like piston engines, many motor designs are not completely stable when running at low speed. Therefore, if the motor drives the wheel without reduction gear directly, the torque transmission will have some nonlinearity, unless you carry out engineering design at a certain cost and run at the lowest speed in a very short time, it cannot really prove your rationality. On the contrary, the reduction gear is helpful for smooth operation, because you can run at least tens or hundreds of RPM, so small nonlinearity will be suppressed by the inertia in the transmission system. The function of wiper relay in the circuit is mainly to automatically adjust, switch the circuit and protect the safety.
