Wire guided balloon dilation catheters are medical devices used in minimally invasive procedures to treat various conditions in the cardiovascular system. These catheters consist of a flexible tube with an inflatable balloon at the tip, which can be guided through blood vessels to the target area.

The wire guided aspect of these catheters refers to the presence of a thin wire that runs through the length of the catheter. This wire provides additional support and control during the procedure, allowing the physician to navigate through the blood vessels with precision.

The balloon dilation component of these catheters is used to treat conditions such as stenosis or narrowing of blood vessels. Once the catheter reaches the target area, the balloon is inflated, which compresses the plaque or blockage and widens the blood vessel. This process improves blood flow and can alleviate symptoms associated with the narrowed vessel.

Wire guided balloon dilation catheters are commonly used in procedures such as angioplasty and stenting. They are inserted into the body through a small incision, typically in the groin or arm, and threaded through the blood vessels to the treatment site. The wire provides stability and control, while the balloon allows for precise dilation of the vessel.
