The global Wire Mesh Vibration Dampers market size is predicted to grow from US\$ 34.64 million in 2025 to US\$ 54.77 million in 2032; it is expected to grow at a CAGR of 6.9% from 2026 to 2032.

In 2025, the global production of Wire Mesh Vibration Dampers reached 400 k units, with a price of approximately \$90 per unit and an industry gross profit margin of about 30%.

Wire Mesh Vibration Dampers, also known as metal rubber, are porous composite materials made entirely of woven metal wires. Compared to traditional spiral-wound metal rubber materials, they feature improved molding processes, eliminating significant manual interventions during manufacturing, increasing mechanization, achieving higher overlap, and possessing more stable mechanical properties. Due to their superior properties such as high load-bearing capacity, high damping, high temperature resistance, low temperature resistance, aging resistance, and oil and corrosion resistance, metal mesh rubber surpasses traditional rubber in many aspects and is widely used in aerospace, shipbuilding, and military weaponry industries.

The upstream of the Wire Mesh Vibration Dampers industry chain includes suppliers of raw materials and manufacturing components. These primarily include suppliers of materials and parts such as metal wire, steel plates, springs, nuts, and screws. These suppliers can be domestic or international, and the quality and price of the raw materials and components they provide directly impact the production costs and product quality of downstream enterprises.

The downstream market for Wire Mesh Vibration Dampers mainly includes industries

such as aerospace, defense, special vehicles, railway transportation, offshore oil platforms, and automobiles. Generally, downstream market demand is large and market share is broad. Downstream customers are mostly wholesalers and end-users, who typically consider and evaluate factors such as price, delivery time, quality, and after-sales service. Satisfaction with these factors directly affects their willingness to continue cooperating with upstream suppliers in the future. Therefore, the management level and market development capabilities of downstream enterprises directly affect the production and sales of upstream enterprises.

Wire Mesh Vibration Dampers are a new type of composite damping vibration damper. The metal rubber material that makes up this type of vibration damper is an elastic porous material made by winding metal wire into a spiral shape, weaving it, pressing it into shape, and then heat-treating it. This material possesses characteristics such as vibration reduction, high damping, resistance to aging, immunity to space radiation and particle impacts, resistance to high and low temperatures, and corrosion resistance. In particular, its combination of elasticity and porosity is irreplaceable by other materials, and it is currently receiving increasing attention in aerospace, shipbuilding, submarine, and torpedo military industries.

Commonly used rubber damping materials are prone to thermal stress fatigue and aging under alternating loads, leading to degradation of their elastic damping properties. Furthermore, they have poor resistance to pollution and acid corrosion, and a narrow operating frequency range, necessitating regular replacement and consuming significant manpower and resources. The new metal-rubber vibration damper overcomes these shortcomings of traditional rubber dampers.

With rapid global economic development and increasing industrialization, the demand for metal wire mesh vibration dampers in military, shipbuilding, defense, construction, and transportation sectors has increased significantly, providing unprecedented market opportunities for enterprises.

Simultaneously, continuous innovation and development in fields such as intelligent manufacturing have significantly impacted and propelled the metal wire mesh vibration damper industry, promoting technological innovation and improvement in Wire Mesh Vibration Dampers products.
