In a wireless network, an AP is a networking hardware device that transmits and receives data. An AP connects users to other users within the network as well as serve as the interconnection point between the WLAN and a fixed wire network. Each AP can serve multiple users within a defined network area. When a person moves beyond the range of one AP, they are inevitably handed over to the next AP. A small WLAN requires a single AP; the number needed increases as a function of the number of network users and the physical size of the network.

According to the report, one of the primary drivers in the market is increase in development of smart cities. Government organizations across the world are investing billions of dollars in the development of smart cities or connected cities. This requires public Wi-Fi networks to offer services such as safety and security, access to education, waste and water management, traffic management, infrastructure management, and healthcare to consumers. The Smart City applications demand a wireless network in order to deal with tough situations like complex meshing in outdoor environments. Public Wi-Fi networks offer inhabitants to access the internet with the help of their smartphone and tablet. It also provides LBS to city planners to gain insight about how its inhabitants live and how a smart city functions, in order to provide better services to

people living in smart cities. This, in turn, will create mass demand for wireless APs to be installed in public places.
