Wireless technologies using longer-range directional equipment provide broadband service in remote or sparsely populated areas where DSL or cable modem service would be costly to provide. Speeds are generally comparable to DSL and cable modem. An external antenna is usually required.

Wireless broadband Internet access services offered over fixed networks allow consumers to access the Internet from a fixed point while stationary and often require a direct line-of-sight between the wireless transmitter and receiver. These services have been offered using both licensed spectrum and unlicensed devices. For example, thousands of small Wireless Internet Services Providers (WISPs) provide such wireless broadband at speeds of around one Mbps using unlicensed devices, often in rural areas not served by cable or wireline broadband networks.

Wireless Local Area Networks (WLANs) provide wireless broadband access over shorter distances and are often used to extend the reach of a 'last-mile' wireline or fixed wireless broadband connection within a home, building, or campus environment. Wi-Fi networks use unlicensed devices and can be designed for private access within a home or business or be used for public Internet access at 'hot spots' such as restaurants, coffee shops, hotels, airports, convention centres, and city parks.

Mobile wireless broadband services are also becoming available from mobile telephone service providers and others. These services are generally appropriate for highly-mobile customers and require a special PC card with a built in antenna that plugs into a user's laptop computer. Generally, they provide lower speeds, in the range of several hundred

Kbps.

Fixed wireless access works primarily when two fixed locations are required to be connected directly. Traditionally, enterprises used leased lines or cables to connect two different locations. FWA is cheaper alternative, specifically in densely populated areas. Typically, FWA employs radio links as the communication and connecting medium between both locations. Usually, the fixed wireless broadcasting equipment is hoisted at building roofs on both the locations to ensure an obstruction free data transmission. Each of the FWA devices is configured to be in line of sight or is in a similar direction for better signal reception. Moreover, besides connecting one-to-one locations, FWA can be implemented in point-to-multipoint and multipoint-to-multipoint transmission modes.
