Wireless doorbells have two components, which are a doorbell transmitter and a chime box receiver. When a visitor presses the wireless doorbell button at the front door, the transmitter sends a signal over a designated radio frequency. The receiver present inside the chime box detects the signal and emits a sound. Users can place the chime box anywhere within the range of the doorbell transmitter. Smart doorbells are also wireless doorbells that use Internet to connect with smartphones.

According to the report, one driver in the market is innovation in product design and features. The emergence of wireless technology has changed the way people live. This is because it has paved the way for many discoveries in the field of wireless equipment, wireless doorbells being one of them. Innovations in product design and features are driving the global wireless doorbells market. Hence, the vendors are heavily investing in R&D to introduce products with new features. This also helps them differentiate themselves in the market.
