Wireless electronic scales are a weighing device that combines wireless communication technology and electronic scale technology. Wireless electronic scales are mainly composed of scales, sensors, wireless transmitters, wireless receivers, display instruments, chargers, antennas, and batteries. The scale body is used to carry the object to be weighed, the sensor converts the weight of the object into an electrical signal, the wireless transmitter is responsible for sending the electrical signal in the form of radio waves, and the wireless receiver receives these signals and transmits them to the display instrument for display. When an object is placed on the scale body of the wireless electronic scale, the sensor in the scale body will be deformed by the pressure of the object, and then generate a current or voltage signal proportional to the weight of the object. After the signal is converted by A/D, it is sent out by the wireless transmitter in the form of radio waves. After the wireless receiver receives the signal, it transmits it to the display instrument for processing and display. Therefore, users can read the weight information of the object at a distance without wired connection.

The global Wireless Electronic Scale market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
