Wireless Mesh Network (WMN) is a network topology in which network nodes are connected to each other through wireless links to form a self-organized network. Each node is both a data terminal and a data relay, and can dynamically adjust the network topology to adapt to changes in the environment. Wireless ad hoc networks have the characteristics of automatic configuration, self-healing, and self-optimization, making them have broad application prospects in many fields.

The market development prospects of wireless ad hoc networks are broad, especially in the fields of Internet of Things, smart cities, military communications, emergency communications and other fields. With the continuous development of the Internet of Things, the demand for reliable, flexible, and self-organizing networks increases, and wireless ad hoc network technology will be more widely used.
