## Abstracts

The global Wireless Permanent Makeup Machine market size is predicted to grow from US\$ 149 million in 2025 to US\$ 207 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

A Wireless Permanent Makeup Machine is a portable, cord-free professional cosmetic device dedicated to implanting sterile pigment into the skin's dermal layer for long-lasting makeup effects, which integrates a rechargeable power supply, high-precision drive system and ergonomic design to get rid of the constraint of wired power, enabling flexible operation for makeup artists; it features adjustable working parameters, stable power output and sterile accessory compatibility, ensuring precise control of pigment implantation depth and dosage during use, and is widely applied in facial permanent makeup projects with the core advantages of portability, operational flexibility and high adaptability to different working scenarios.

In 2025, global Wireless Permanent Makeup Machine production reached approximately 389.7 K units, with an average global market price of around US\$ 390 per unit. The production capacity of Wireless Permanent Makeup Machine is approximately 493 K units per year, the average gross profit margin was 28-31%.

The supply chain of Wireless Permanent Makeup Machines presents a closely linked, demand-driven collaborative closed loop: upstream provides core functional components, safe raw materials and matching auxiliary parts, including high-performance rechargeable batteries, miniaturized high-precision drive motors, intelligent control modules, sterile disposable needle cartridges, skin-friendly and durable machine body materials and charging accessories, which directly determine the wireless endurance, operation stability, precision and use safety of the equipment; midstream

undertakes R&D design, precision assembly, strict safety and performance testing and functional debugging, integrating upstream supplies into finished wireless PMU machines that meet cosmetic industry safety standards and operational requirements, and optimizes product structure according to downstream demand feedback; downstream covers multi-level sales channels and terminal cosmetic scenarios, and the differentiated demands of terminal users for wireless endurance, portability, parameter adjustability and sterile performance will be transmitted backward to drive midstream to upgrade assembly processes and optimize product functions, while forcing upstream to improve component miniaturization level, battery endurance and accessory safety, forming a linkage pattern of upstream supply support, midstream value transformation and downstream demand traction.

The cost structure of Wireless Permanent Makeup Machines is dominated by core functional components, with a clear hierarchy of cost distribution: the largest proportion comes from core electronic components and power supply system costs, including high-performance rechargeable batteries, miniaturized high-precision drive motors and intelligent control modules, whose quality directly determines the wireless endurance and operation stability of the equipment, so the procurement cost accounts for the highest proportion; followed by the cost of sterile auxiliary parts and machine body raw materials, as sterile disposable needle cartridges and skin-friendly, durable machine body materials need to meet cosmetic safety standards, bringing certain cost input; in addition, there are precision assembly and safety inspection costs, relying on professional labor for component fitting and multiple rounds of performance and safety testing to avoid use risks; the rest includes R&D design costs for optimizing wireless endurance, ergonomic design and parameter adjustability, as well as marketing circulation and after-sales maintenance costs covering channel layout, brand promotion and battery replacement.
