The global Wood Chip Dryer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A wood chip dryer is a machine designed to reduce the moisture content of wood chips for use as a fuel for heating boilers, furnaces, and biomass power plants, as well as for animal bedding and other industrial applications. The dryer works by blowing hot air through the wood chips, evaporating the moisture and drawing it out of the material. There are several different types of wood chip dryers, but the most common are rotary dryers and flash dryers. Rotary dryers are larger and more expensive and are used for high-capacity production. In a rotary dryer, wood chips are placed in a rotating drum and hot air is blown through them. Wood chip dryers play a critical role in the production of wood fuel and other applications where low moisture content is important. They offer a cost-effective way to remove moisture from wood chips, allowing them to be used more effectively as a fuel and opening up new possibilities for their use in industry.

United States market for Wood Chip Dryer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
