Abstracts

The global Wood Milling Machine market size is predicted to grow from US\$ 780 million in 2025 to US\$ 1067 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

In 2025, global Wood Milling Machine production reached approximately 49,853 Units. The average price is approximately \$16,000. A wood milling machine is a mechanical device used for cutting, shaping, grooving, contouring, and surface machining of wood or wood-based composite materials. It uses a rotating cutting tool to process the workpiece in multiple directions, achieving precise dimensions and complex shapes.

Gross Profit Margin Levels

The gross profit margins in the wood milling machine industry exhibit a clear product structure stratification. For manufacturers primarily producing traditional vertical spindle milling, profile milling, and basic stand-alone equipment, costs are mainly concentrated in castings/steel structures, spindle motors, guide rails and lead screws, electrical control, sheet metal, and assembly. Price competition is also more intense, resulting in a typical gross profit margin of 18%-28%. For mid-to-high-end CNC wood milling machines equipped with automatic tool changers, CNC linkage, software systems, five-axis machining heads, and automated loading and unloading units, the added value and system integration premium are higher, typically increasing the gross profit margin to 28%-40%. A very small number of high-end five-axis woodworking machining centers, flexible work units, and customized production line projects can achieve even higher margins. Publicly available comparable companies also illustrate this stratification: KDT's gross profit margin in recent years has been around 30%, while Nanxing's most

recent disclosure is around 19%, indicating a significant gross profit margin difference between high-end CNC machines and mass-produced standard models. Overall, the gross profit margin of the wood milling machine industry is roughly between 22% and 35%. The key to profitability lies not only in the machine itself, but also in CNC systems, software, automation integration, and after-sales service.

Industry Drivers

The growth of the wood milling machine industry is primarily driven by the long-term existence and upgrading of downstream demand from furniture, custom home furnishings, wooden doors and windows, stairs, and wood component processing. Secondly, rising labor costs and a shortage of skilled woodworkers are propelling companies to migrate from traditional vertical spindle milling to CNC wood milling machines, automatic tool changers, five-axis machining, and flexible units to improve consistency, reduce setup time, and adapt to multi-variety, small-batch production. Thirdly, woodworking equipment is moving from stand-alone machines to digital and integrated systems. Many manufacturers have integrated milling, drilling, cutting, grooving, contouring, and complex surface machining into a single woodworking machine, significantly increasing the equipment's value. Finally, the global woodworking machinery market continues to grow, and the publicly reported CAGR of the wood milling machine segment is slightly higher than the overall market, indicating that wood milling/forming equipment remains one of the most active segments in the upgrading of woodworking equipment. The focus of future industry competition will not be just whether or not there is equipment, but who can provide higher precision, higher automation, less changeover time and stronger software/production line collaboration capabilities.
